

Centre for Building Biology

Auroville

The Centre for Building Biology is located in the international township of Auroville in Tamil Nadu, South India.

India is a country with many challenges for Building biology. There is a need to create awareness about the effects that modern building practises have on the well-being of its inhabitants. Architects, builders and all those responsible for the design of new buildings need to be made aware of their responsibility to create healthy living environments. Research is needed to deal appropriately with climatological as well as cultural issues specific for India. Many sick building are waiting for treatment. To be able to do all this more Building Biology professionals are needed.

Educations and informing professionals in construction as well as health care is necessary to recognise and prevent issues related to recent developments. The Centre for building biology is willing to share information and give presentations to all interested in this topic. For those who wish to go further and become Building Biology consultant we have a partnership with the IBN to facilitate the IBN online correspondence course.

Apart from education the CBB is doing house investigations, mainly focussed on electromagnetic pollution. And we advise architects, builders and home owners how to create more healthy indoor climates. We are also active in the construction of new sustainable buildings using natural and traditional building materials and techniques.
